GLOBALTECH INC. | PHISHING RISK DASHBOARD

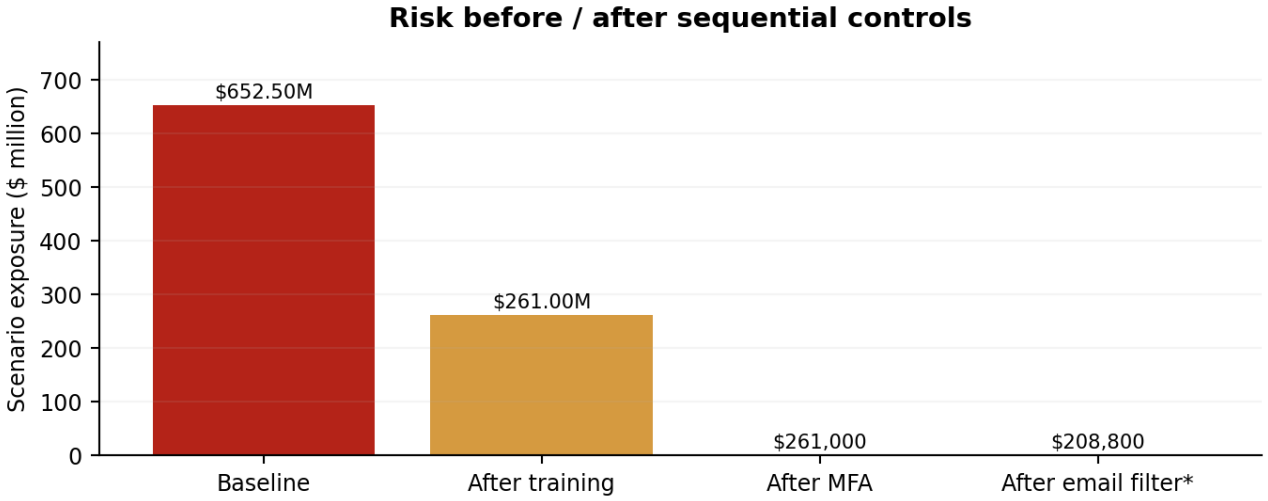

Executive decision brief • Scenario-based analysis of three phishing simulations • 1 November 2026

430	105	24.42%	$652.5M
Emails sent	Credentials submitted	Weighted credential rate	Campaign B scenario exposure

Key risk: The IT Password Reset simulation had the highest credential submission rate (30%). The $652.5M figure is a mathematical extrapolation using an unspecified annual breach frequency, not a validated forecast.

Recommended investment: prioritise phishing-resistant MFA ($90K), targeted awareness ($100K), and email filtering ($50K); the full six-initiative programme totals $490K.

Illustrative sequential residual: $208,800 after training, MFA and assumed filtering; the result depends on optimistic, overlapping control-efficacy assumptions. Validate actual incident rates, control effectiveness, ongoing costs and population representativeness before budget approval.
